

HIV Care and Treatment Services: CLM Feedback Analysis

This report summarizes patient and community feedback on HIV care and treatment services and focuses on service experience, access barriers, client satisfaction, and the main improvement priorities emerging from open-ended responses.

Total responses 23,457 client and community records	Positive satisfaction 89.6%
Access challenges reported 22.4%	Confidentiality respected 89.0%
Rights awareness 79.9%	Average sentiment score 0.434

Background and Context

This analysis is grounded in a community-led monitoring style of review, where patient and client voices are treated as a core source of evidence on how services are experienced at facility level. The framing is also consistent with the inception material, which emphasizes mixed methods, direct stakeholder voice, and reader-friendly presentation of charts, tables, and findings.

In Kenya, this work sits within a broader HIV response ecosystem that includes community networks such as NEPHAK, national and county health structures, and global HIV partners such as PEPFAR/USAID, UNAIDS, the Global Fund, WHO, and other implementing organizations working on prevention, treatment, retention, and community systems strengthening. The report itself stays focused on the survey evidence and what respondents said about service delivery.

Overview

The analysis covers 23,457 responses, with the largest share coming from CLM feedback and the strongest county concentration in Homa Bay, Kilifi, Makueni. Overall satisfaction is high, but the comments also show clear operational concerns that should inform quality improvement and client support discussions.

Across the dataset, respondents most often praise friendly staff, respectful treatment, and good service delivery. The strongest recurring concerns relate to medicines and supplies, food and transport support, equipment and infrastructure, and waiting time.

Survey Coverage

Survey module	Responses
---------------	-----------

CLM Feedback	21,661
App quality feedback	902
Mental health survey	639
COVID-19	250
Feedback	4

County	Responses
Homa Bay	13,048
Kilifi	5,665
Makueni	2,857
Kisii	199
Nairobi	193
Unknown	191

Demographic Data

Gender	Responses	Age group	Responses
Female	14,646	31 to 55	5,473
Male	7,538	18 to 30	5,354
Adolescent Girl/Boy	154	35-44	3,527
Prefer not to answer	22	25-34	2,758
		45-54	2,743
		55-64	1,184

Approach and Methodology

1. The workbook was extracted and cleaned into a structured dataset with harmonized dates, counties, respondent fields, and service indicators.
2. Core service indicators were standardized, including satisfaction, access challenges, confidentiality, rights awareness, equipment adequacy, and counseling-related feedback.

3. Open-text responses on likes, dislikes, improvement requests, access barriers, and mental health concerns were reviewed using sentiment scoring and theme tagging.
4. Recurring issues were grouped into practical themes such as staff attitude, medicines and supplies, waiting time, access cost, equipment and infrastructure, confidentiality and stigma, and counseling or mental wellbeing.
5. Findings were then summarized into tables, comment excerpts, and simple text visuals that can be used directly during a meeting or presentation.

Accessibility to Health Care Services

Priority theme	Mentions	Share of all responses
Staff attitude and respect	14,057	59.9%
Medicines and supplies	10,875	46.4%
Food and transport support	8,368	35.7%
Equipment and infrastructure	7,646	32.6%
Waiting time and flow	5,427	23.1%
Access and affordability	3,735	15.9%

The strongest positive signal in the feedback is relational quality. Respondents repeatedly describe friendly staff, respectful reception, caring providers, and timely service. These are important strengths to protect because they shape trust, continuity of care, and willingness to return to the facility.

On the challenge side, the comments concentrate around more, drugs, time, additional, support, staffs. The narrative around dissatisfaction is less about staff interaction and more about practical bottlenecks that affect access, continuity, and perceived quality.

Satisfaction mix

Sentiment mix

Top counties by response volume

Level of Satisfaction with Services

Satisfaction levels are generally strong, and the sentiment mix is largely positive. Even so, the open comments show that high satisfaction scores can exist alongside recurring operational issues, particularly where medicines, transport support, supplies, and waiting time are involved.

Most common themes in open comments

What Clients Liked About the Facility

The most common positive descriptions point to staff friendliness, good reception, respectful treatment, and supportive care. These comments suggest that interpersonal quality remains one of the strongest drivers of positive client experience in the facilities represented here.

Positive language

good are friendly staff
drugs staffs free providers delivery
available art was reception health

Improvement language

more drugs time additional
support staffs satisfied improve
enough availability equipments food
not supply

What Needs to Be Improved

The improvement responses show that clients are not only commenting on quality in the abstract; they are describing specific gaps that affect the care experience. The most repeated requests are more reliable medicines and supplies, stronger food and transport support, better equipment and infrastructure, and shorter waiting time.

Challenges

The comments point to a clear set of recurring barriers. Respondents want more reliable medicines and supplies, better food and transport support, improved equipment and infrastructure, and shorter waiting time. These are the issues most likely to reduce access and satisfaction if they persist.

A smaller but important part of the workbook focuses on mental health and community support. In that section, the language shifts toward counseling, psychosocial support, depression, anxiety, violence, and economic stress. This suggests that the same analysis workflow can also support broader community wellbeing reviews when needed.

What Clients Appreciated

Homa Bay | CLM Feedback

"The good services and friendly staffs at this facility it so amazing"

Themes: Staff attitude, Medicines and supplies, Food and transport support

Homa Bay | CLM Feedback

"Good health care system"

Themes: Staff attitude, Medicines and supplies, Food and transport support

Kilifi | CLM Feedback

"The free art drugs issued for my well being"

Themes: Staff attitude, Medicines and supplies, Food and transport support, Access and affordability

What Clients Want Improved

Homa Bay | CLM Feedback

"Lack of enough medicine and equipment that lead to referrals"

Themes: Staff attitude, Medicines and supplies, Equipment and infrastructure, Access and affordability

Kilifi | CLM Feedback

"Long queing"

Themes: Food and transport support, Confidentiality and stigma, Access and affordability

Homa Bay | CLM Feedback

"Failure to treat other illnesses by the facility"

Themes: Waiting time

Recommendations

1. Maintain and reinforce the positive service culture already visible in the comments, especially respectful reception, friendliness, and client-centered care.
2. Prioritize operational fixes around medicines and supplies, transport and nutrition support, equipment, and waiting time because these issues appear repeatedly across improvement comments.
3. Review county and facility patterns regularly so that the same feedback can be used for targeted supervision, supportive coaching, and follow-up action on recurring service bottlenecks.
4. Continue pairing quantitative indicators with open comments during presentations and review meetings, because the narrative evidence helps explain why otherwise strong satisfaction scores may still coexist with specific access challenges.
